GeoEarthScope "NoCAL" San Andreas System LiDAR pre computed DEM tutorial

J Ramón Arrowsmith Chris Crosby School of Earth and Space Exploration Arizona State University <u>ramon.arrowsmith@asu.edu</u> <u>http://lidar.asu.edu</u>

April 29, 2008

Overview

This simple data and ArcGIS demonstration will illustrate:

- The spatial distribution of GeoEarthScope LiDAR data imaging the northern San Andreas Fault that was recently delivered from the National Center for Airborne Laser Mapping (NCALM)
- The data types and formats that are currently available as GeoEarthScope LiDAR data
- How to display and manipulate the data in ArcMap and ArcScene.

Data set overview

The GeoEarthScope Northern California LiDAR project acquired high resolution airborne laser swath mapping imagery along major active faults as part of the EarthScope Facility project funded by the National Science Foundation (NSF). Between this project and the previously conducted B4 project, also funded by NSF, the entire San Andreas fault system has now been imaged with high resolution airborne LiDAR, along with many other important geologic features. EarthScope is funded by NSF and conducted in partnership with the USGS and NASA. GeoEarthScope is a component of EarthScope that includes the acquisition of aerial and satellite imagery and geochronology. GeoEarthScope is managed at UNAVCO.

Data delivery scheme

We are receiving the data as its processing completes from the UC Berkeley arm of NCALM. In this demonstration, we will play with the filtered and unfiltered 1km x 1km ArcInfo grids @ 0.5m cell size and their shaded relief maps (NO overlap).

Due to ArcInfo file naming limitations, the grids contain only the significant digits from the lower left coordinate of their originating tile. For example, the ASCII tile named "f571000_4130000.xyz" corresponds to the ArcInfo elevation grid named "fg571_4130" and shaded relief map "fg571_4130shd". Filtered elevation grids are prefixed by "fg" and the hillshades end in "shd". Unfiltered elevation grids are prefixed by "ug" and the hillshades end in "shd"

For all these data the projection is UTM Zone 10N, WGS84 ellipsoid heights.

Data access

We assume that you know how to get into the Geon LiDAR Workflow pages inside the GEON Portal:

<u>http://www.geongrid.org</u> -> "Enter the GEON Portal" -> Login (as guest, or register) -> Tools tab -> LiDAR.

Click on the GeoEarthScope Northern California LiDAR Project (NoCAL) link.

The interactive map shown below permits users to download 1 km^2 filtered ("bare earth," fg*) and unfiltered (ug*) 0.5 m resolution digital elevation models in Arc Binary grid format. The dataset extent is shown on the map as yellow polygons. There is a download "button" for each 1 km^2 tile in the dataset. You will need to zoom into the area of interest to see all of the buttons. To navigate, use the standard GoogleMaps + to zoom in, - to zoom out, the arrows to pan, or just grab the image to pan.

Zoom in to the area of interest. When you are getting close, the center points of the tiles will appear. To download a DEM click the button and then select the link that appears in the pop-up window. The DEMs are delivered in zipped archives for download.

*Note that in places, a second set of tiles may be available for a given location (the area was flown twice). They will have a flight number appended to their name (583_4120_07_088.zip).

In this demo, download and unzip 4 adjacent tiles.

Simple data processing in ArcMap

Loading the files

Launch ArcMap (Programs->ArcGIS->ArcMap)

Push the **Add data** button and the following window will open. Use the **Connect to folder** button to browse to the location where you saved the (unzipped) data. When you press OK, you will see the folder that contains the DEM file in the 'Add data" window. Double-click it, select the file and add it.

Load the rest and move them up and down the left window so that all of the unfiltered are above all of the filtered.

Mosaicking the files

You do not have to do this, but it makes things generally more convenient. Just be careful that the more tiles that you mosaic, the bigger the result will become. The mosaicking tool is accessible in the ArcToolbox. Click on the little red box on the toolbar, and then on the little +s in front of Data Management Tools->Raster->Mosaic To New Raster.

Dout	ble click on Mosaic To New Raster.			
🞦 Mosai	c To New Raster			X
	Total Destant			^
•		-

				=
			음	
			<u> </u>	
			+	
•	Output Location			
				
•	Raster dataset name with extension		_	
				~
	OK Cancel Environments	Sł	iow Help >>	

Click on the downward pointing triangle and highlight one at at time the files you want to mosaic (all of the unfiltered—ug* for now).

After the files are identified, then click on output location and make a new directory (in this case Mosaics), and then click Add.

Output Locat	ion		
Look in: 🔯	E:\		8-8- 8-8- 8-8-

Name:	New Folder		Add
Show of type:	All filters listed.	•	Cancel

Name the resulting mosaic (make sure that the filename is less than 13 characters long).. Make sure that the Pixel_Type is 32_BIT_FLOAT. You can leave all the other boxes empty. You are ready to go so Push OK. A screen will appear that gives you an indication of progress.

You will see the resulting mosaic appear on the left with the other rasters.

Do it again with the filtered data. Note that I clicked the little – next to the layers so we could collapse the display for them. And, I closed the toolbox.

How to produce a hillshade map

• In order to produce the hillshade map, you will need use the **Spatial Analyst** tool. If you can't find it in your tool bar: Go to **View** => **Toolbars** and check the **Spatial Analyst**. Now you should find it in the toolbar

- Also, make sure that you have access to some of the essential **Extensions**: Go to **Tools**
- => Extensions and check the 3D Analyst and Spatial Analyst.
- Now open the pull-down menu **Spatial Analyst** => **Surface Analysis** => **Hillshade**

- In the window that will open (figure next page), you can choose the DEM (**Input surface**) from which you want to produce the hillshade map. The following window gives you a couple of options:
 - You may change the **Azimuth** and **Altitude** of the 'sun' that illuminates the region
 - Check the 'Model shadows' button
 - You may exaggerate the elevations by the **z-factor** -this is especially helpful in flat, low-relief areas.
 - The **Output cell size** tells you the size (in m) of each cell; in our example, the 0.5 is the DEM spatial resolution of 50 cm per pixel)
 - You may want to save the hillshade map (Output raster)...

Alternate between the unfiltered and filtered ("bare earth") DEMS by clicking on the *Hillshade of ug_mos and* then turning on and off the *Hillshade of g_mos* Layer which should be above it.

Raster math: subtracting the filtered DEM from the unfiltered DEM to make a canopy height map

One of the powerful capabilities of ArcMap with respect to raster data is performing mathematical and Boolean operations on the grids. In this case, we will subtract the filtered or bare earth DEM from the unfiltered one (effectively it is the top of the canopy) to produce a canopy height map.

Under Spatial Analyst (see above under Hillshade if you have not gotten it going yet), select Raster Calculator.

🇰 Raster Calculato	or					(? 🗙
Layers:							
fg_mos fg582_4119	×	7	8	9	=	\diamond	And
fg582_4120 fg583_4119 fg583_4120		4	5	6	>	>=	Or
Hillshade of fg_mos Hillshade of ug_mos		1	2	3	<	<=	Xor
	+		2		()	Not
[ug_mos] - [fg_mos]							
							~
About Building Expre	ssions		<u>E</u> valua	te	Canc	el	>>

Click on **ug_mos**, then click the – sign, then click the **fg_mos** and push *evaluate*. The result will be a layer on the left called **Calculation**.

You can make it permanent by right clicking on it, and then selecting *Data->Make Permanent*.

Remove the **Calculation** from the Layers (right click and select Remove) and then add the **Canopy** raster. Give the **Canopy** a different color map by right clicking and selecting *Properties->Symbology* tab. Choose a different, probably greenish, Color Ramp. Then push ok.

An interesting effect can be achieved by displaying the canopy semi-transparently over the filtered hillshade. It can also be nice on top of the unfiltered hillshade.

		-
Display Sour		
Frank,		9 302 Matars

One detail to consider is that some of the canopy values are negative and the lowermost part of the canopy is probably bushes and whatnot. To display the canopy down to let's say 2 meters height, do the following. Right click on the **Canopy** layer and select *Properties->Symbology* tab.

Then Show Classified on the right.

Choose 8 classes.

Set the color ramp.

					ок	Cancel	

Click on Classify. Change the first break value to 1 or 2 meters. Move the others around if you want.

Then go back and double click on the color box (under the symbol category for the first level and make it *No Color*.

Arc Scene Demonstration

Viewing the Lidar data in a "3D" view can be astonishing and the viewer can often see many features not evident just in the map view. Thus, we will use the ArcScene program available as part of the ArcGIS suite.

- 1) Quit ArcMap if you have not already and launch ArcScene from Start->All Programs->ArcGIS->ArcScene.
- 2) Click the plus symbol inside the yellow box to add some data:

4) Right click on *ug_mos* Layer in the Table of Contents at left and choose **Properties**.

5) Choose the **Base Heights** tab in the next screen. Click on the Obtain heights for layer from surface: and navigate to find the same DEM as you had just loaded (it is going to be "draped" on itself. Push **Apply**. Note that you can come back to this screen and click on the **Raster Resolution** to change the resolution of the resulting image if you want to sharpen it (but watch out for how much memory it will cost you).

0		1	1
Obtain heights for layer from surface.			-
Rate Resultion.	ononuoutie (S	amper (💌	
Unit Conversion lopply conversion factor to place heights in same units as scene.	custom		1.0000
Muet Add an offset using a constant or expression			
0			1

6) Choose the **Rendering** tab. Click on the **Shade areal features relative to the scene's light position**. Also, slide the bar for **Quality enhancement for raster images** all the way to the right to **High**. You may get a warning about the memory resources that this may require, but go ahead and try it. Push **Ok**.

7) Change the color of the surface. Right click on the *ug_mos* Layer in the Table of Contents at left and choose **Properties**. Select the **Symbology** tab and change the color ramp to a greenish one.

now:	
lassified	Draw raster stretching values along a color ramp
	Color Value Label 864.218811 #igh : 864.218811 368.709930 Low : 368.709930 Color Ramp: Display Background Value: 0 as
